INSTRUCTION

Personal Tutor

Chat with the AI tutor the way you would with a real tutoring product.

You want to actually understand one specific thing — not to collect links or finish someone's homework. Pick a topic that genuinely fits your life: something from your work, a hobby, money, health, technology you use, or a decision coming up. Keep it to one topic for the whole conversation.

Tell the tutor what you want to learn and roughly where you're starting from. Share your background gradually, the way you would with a real person. When an explanation goes over your head, say so. When it feels too basic, say that too. Answer the tutor's questions honestly, and try to restate ideas in your own words when it checks whether you followed.

Keep going until you can tell whether you actually made progress on the thing you wanted to understand — then wrap up.

CONTEXT

About the product

You're using DeepTutor, an AI tutoring assistant. It works like a one-on-one tutor in a chat window: you tell it what you want to learn, and it explains, answers follow-up questions, gives examples, and checks whether you're following.

What a typical user does with it:

- Ask it to explain a concept ("what actually is compound interest?")
- Work through something step by step ("walk me through reading this blood test result")
- Get unstuck on a skill ("why does my sourdough never rise?")
- Prepare for something ("help me understand what to ask at a parent-teacher conference")

It responds in text, adapts to what you tell it about yourself, and can go deeper or simpler on request. It cannot see your screen, browse with you, or do things outside the chat.
