INSTRUCTION

Choose your next book on Open Library

Your situation

You are choosing one book to read next. Read the scenario brief in input/context.md, then use the live Open Library website to make the choice.

Your goal

Search or browse the public catalog, open and inspect at least three distinct book detail pages (work pages), compare the books, and choose the one you would most want to read next.

Constraints on your behavior

- Use only information visible on the live Open Library site. Do not invent titles, authors, publication dates, subjects, or descriptions.
- Choose as yourself: your interests, reading habits, available time, and life situation decide what fits — not what sounds most prestigious.
- Do not log in, borrow, download, donate, purchase, share, contact anyone, or visit a third-party site.

Interaction requirements

Use the live website in the browser. Compare book descriptions, subjects, authors, and publication information when they are relevant to you. Save your choice to /app/output/book_choice.json:

```
``json
{
  "decision_subject_id": "<Open Library work ID from the selected URL, e.g. OL45804W>",
  "decision_subject_label": "<book title copied from the main heading of its work page>",
  "decision_outcome": "selected",
  "basis_primary": "<price|quality|features|convenience|taste|trust|familiarity|novelty|fit|other>",
  "basis_secondary": "<optional second value from the same enumeration>",
  "exploration_style": "<compared_multiple|deep_research>",
  "reason": "<why this book fits your interests, reading habits, and situation, grounded in the pages you inspected>",
  "task_book_url": "https://openlibrary.org/works/<work-id>/<title-slug>",
  "task_book_author": "<author name exactly as shown on the work page>",
  "task_book_first_published": "<first publication year exactly as shown>",
  "task_options_considered": [
    {
      "decision_subject_id": "<work ID>",
      "decision_subject_label": "<book title copied from the main heading of its work page>",
      "task_book_url": "https://openlibrary.org/works/<work-id>/<title-slug>",
      "task_book_author": "<author name exactly as shown>",
      "task_book_first_published": "<first publication year exactly as shown>",
      "task_relevance_note": "<why this was a plausible candidate for you>"
    }
  ]
}
```

web-openlibrary-evidence-final

}
,

Termination criteria

- task_options_considered must contain at least three distinct books whose work pages you actually opened.
- For every book you record, copy its title from the main heading of that book's work page, not from a search result, list card, browser title, or snippet.
- The selected book must appear in task_options_considered, with matching title, work ID, URL, author, and first-published year.
- Use the Open Library work ID from the URL (the OL...W part) as decision_subject_id.
- Keep titles, authors, and years faithful to the live pages; do not invent metadata.
- basis_secondary is optional. If included, it must differ from basis_primary.
- Because comparison is required, use compared_multiple or deep_research for exploration_style.
- Keep reason` specific to what matters to you and evidence from the selected book's page.
- Finish after saving the completed JSON file.

Success judgment

The task is successful when the saved JSON follows the required structure, the candidate list contains at least three work pages you visited, the selected book matches one candidate, and all recorded titles, work IDs, URLs, authors, and years are faithful to the live site.

CONTEXT

About the site

You're using Open Library (openlibrary.org), the Internet Archive's free public book catalog. It works like an online library card catalog covering millions of books: you can search by title, author, or subject, browse curated subject pages, and open a detail page ("work page") for any book.

A work page shows the book's title, author, description, subjects, first publication date, editions, and reader ratings. Nothing requires an account; you're only browsing and comparing.

You came here because you want something new to read and would rather pick deliberately than grab whatever is nearest. Browse the way you naturally would — by a favorite subject, an author you've heard of, or plain curiosity.
